Steam Deck LCD (256GB+)

- **Status**: Platinum

Post-Installation Setup

- No additional setup required, but make sure to read the installation Guide.
- It should function nearly identical to SteamOS with the benefits of Fedora Atomic Desktop:
    - Layer Fedora packages to the image without losing them between updates/reboots.
    - Newer package upgrades including the Linux kernel and drivers.
    - Printing support and other basic features that would make Bazzite viable for daily usage.
- View our FAQ for more information.

Steam Deck OLED

- **Status**: Gold

Post-Installation Setup

- No additional setup required, but make sure to read the installation Guide.
- It should function nearly identical to SteamOS with the benefits of Fedora Atomic Desktop:
    - Layer Fedora packages to the image without losing them between updates/reboots.
    - Newer package upgrades including the Linux kernel and drivers.
    - Printing support and other basic features that would make Bazzite viable for daily usage.

Workarounds / Known Issues

- Similar to using Bazzite on the Steam Deck LCD, but currently suffers from the following:
    - Installer requires **Basic Graphics Mode**.
